1. The examiner notes the following:

a) That the instant specification was filed with only one figure (e.g. figure 1);

b) That the one figure of the instant specification pertains to the "prior art" and not to the alleged invention (SEE: paragraph 0008 of the instant specification); and

c) That the pending claims admit of an illustration in that they are drafted in the form of method claims having discrete sequences of steps; i.e. such can easily be illustrated via a flowchart.

Art Unit: 2614

2. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the "methods" having the "steps" that are recited in claims 1-10 must be shown or these feature(s) canceled from the claim(s) [note paragraph 1 of this Office Action]. No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

3. The instant written description describes a mathematical equation/"algorithm" which can be programmed into a computer and used to calculate an "objective sharpness quality score" for a given set of variables entered therein wherein, as described, said variables can be derived from the processing of "real-world" quantities/signals [SEE: paragraph 0032 of the instant description]. However the pending claims, as currently drafted, appear to be directed to the mathematical algorithm itself and do not appear to be recite steps for deriving the variables from the real-world quantities/signals; i.e. the claims do not recite:

a) Steps in which real-world image signals are received and/or processed by the disclosed/recited algorithm;

b) Steps in which a physical transformation results outside of the "computer" which is performing the disclosed/recited algorithm;

c) etc,...

That is the pending claims, as currently drafted, do not appear to fall within any of the "Safe Harbors" that are discussed in accordance with the guidelines set forth in section 2106 of the MPEP.

4. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

5. Claims 1-10 are rejected under 35 U.S.C. 101 because, as currently recited, they are directed to non-statutory subject matter [SEE: paragraph 3 of this Office Action].

6. The following references have been cited:

a) Kuwata et al. [EP 1,365,355] has been cited because it illustrates an automated edge enhancement system. While this reference itself is not "prior art", it claims priority back to Japanese document #JP 14405997 which was filed 2/6/1997.

b) Kenji [JP 59-040756] has been cited because it describes a system which detects picture quality based on one and two dimensional coding and signal transitions.

c) Inou [US # 6,097,847] has been cited because it calculates a sharpness value (S) for incoming video sequences;

d) Akiyama et al. [US #5,272,533] has been cited because it shows a system which generated an image quality control signal for controlling image quality;

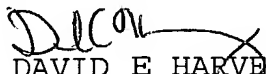

e) Apostolopoulos et al. [US #5,850,294] has been cited because it shows a system for filtering video signals based on true and false/non edges.
